## INTRODUCTION

The S6B0108 is a LCD driver LSI with 64 channel output for dot matrix liquid crystal graphic display systems. This device consists of the display RAM, 64 bit data latch, 64 bit drivers and decoder logic. It has the internal display RAM for storing the display data transferred from a 8 bit micro controller and generates the dot matrix liquid crystal driving signals corresponding to stored data. The S6B0108 composed of the liquid crystal display system in combination with the S6B0107 (64 channel common driver).

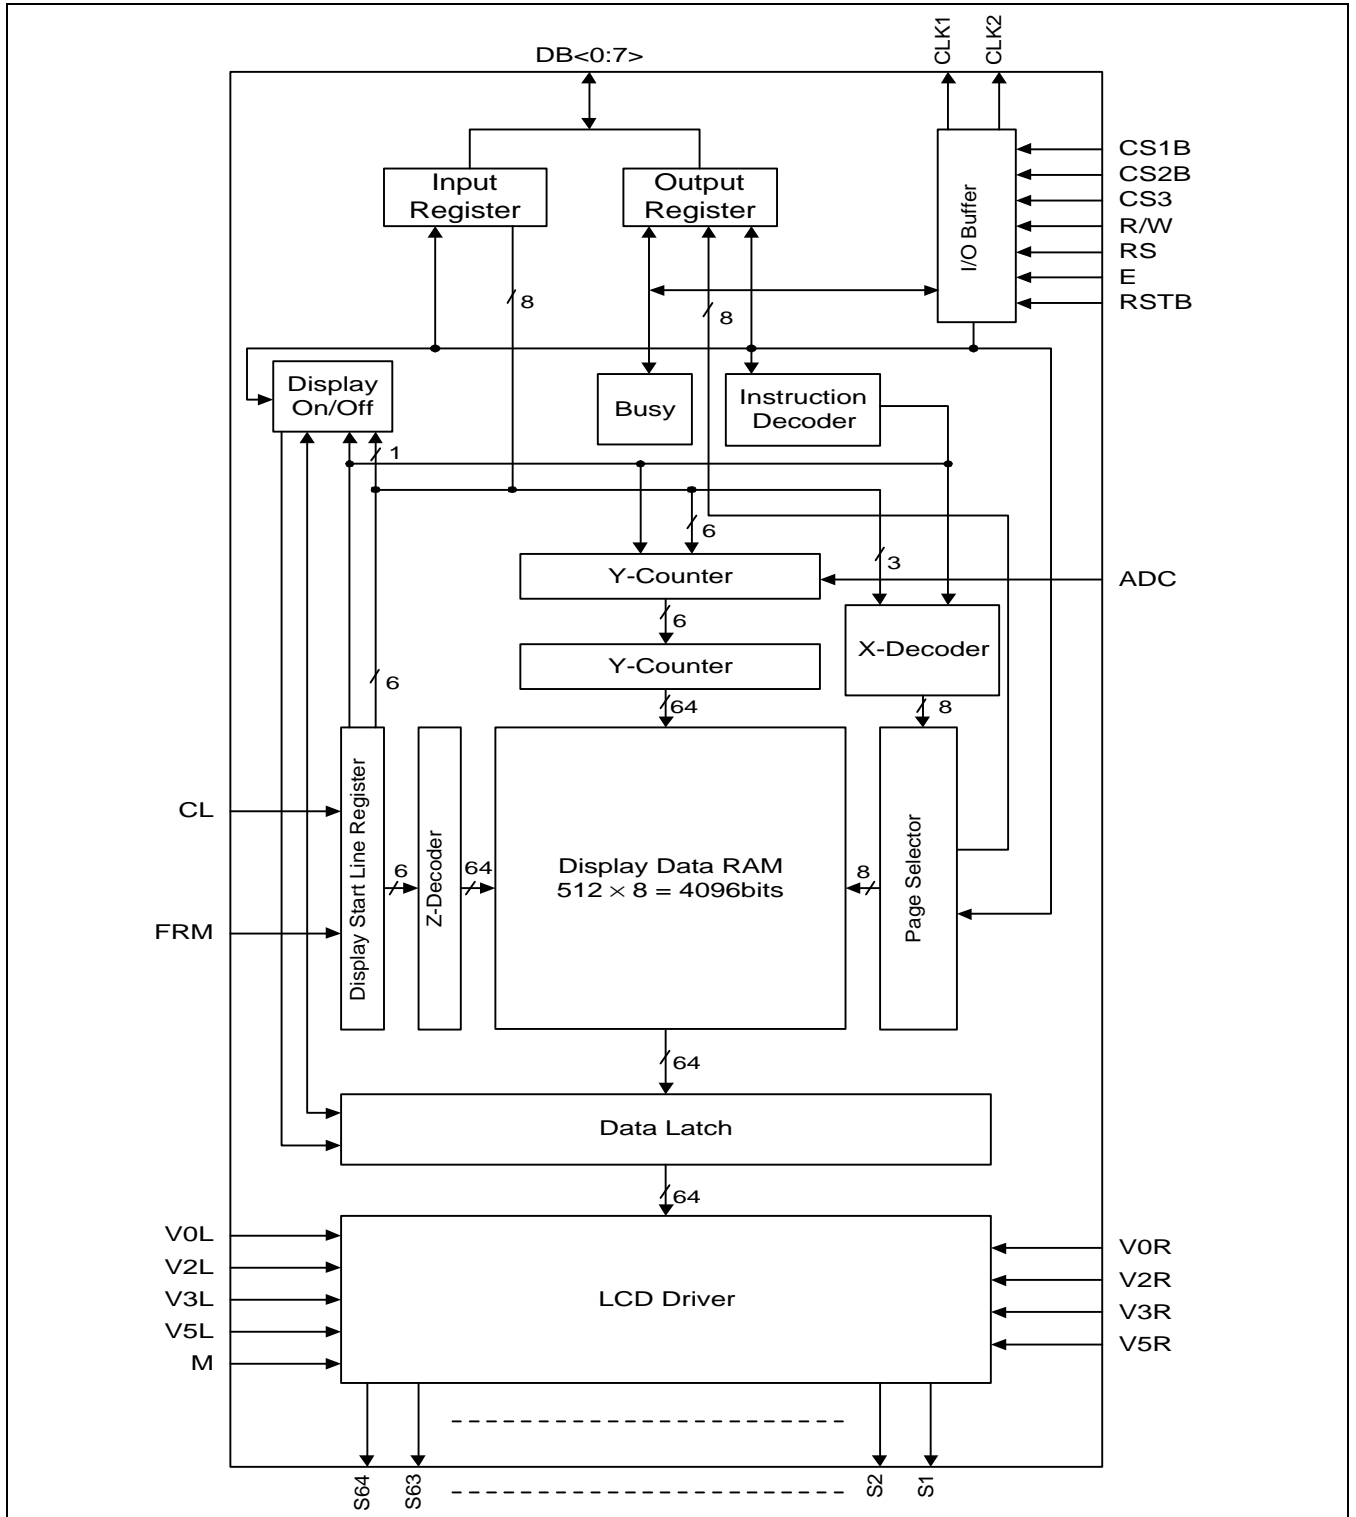

## FEATURES

- Dot matrix LCD segment driver with 64 channel output
- Input and output signal
  - Input: 8 bit parallel display data control signal from MPU divided bias voltage (V0R, V0L, V2R, V2L, V3R, V3L, V5R, V5L)
  - Output: 64 channel for LCD driving.
- Display data is stored in display data RAM from MPU.
- Interface RAM
  - Capacity: 512 bytes (4096 bits)
  - RAM bit data: RAM bit data = 1: On  
RAM bit data = 0: Off
- Applicable LCD duty: 1/32-1/64
- LCD driving voltage: 8V-17V ( $V_{DD}-V_{EE}$ )
- Power supply voltage: + 5V  $\pm$  10%
- Interface

## OPERATING PRINCIPLES AND METHODS

### I/O BUFFER

Input buffer controls the status between the enable and disable of chip. Unless the CS1B to CS3 is in active mode, Input or output of data and instruction does not execute. Therefore internal state is not change. But RSTB and ADC can operate regardless CS1B-CS3.

### INPUT REGISTER

Input register is provided to interface with MPU which is different operating frequency. Input register stores the data temporarily before writing it into display RAM. When CS1B to CS3 are in the active mode, R/W and RS select the input register. The data from MPU is written into input register. Then Writing it into display RAM. Data latched for falling of the E signal and write automatically into the display data RAM by internal operation.

### OUTPUT REGISTER

Output register stores the data temporarily from display data RAM when CS1B, CS2B and CS3 are in active mode and R/W and RS = H, stored data in display data RAM is latched in output register. When CS1B to CS3 is in active mode and R/W = H, RS = L, status data (busy check) can read out. To read the contents of display data RAM, twice access of read instruction is needed. In first access, data in display data RAM is latched into output register. In second access, MPU can read data which is latched. That is, to read the data in display data RAM, it needs dummy read. But status read is not needed dummy read.

RS	R/W	Function
L	L	Instruction
	H	Status read (busy check)
H	L	Data write (from input register to display data RAM)
	H	Data read (from display data RAM to output register)

## RESET

The system can be initialized by setting RSTB terminal at low level when turning power on, receiving instruction from MPU.

When RSTB becomes low, following procedure is occurred.

- Display off
- Display start line register become set by 0. (Z-address 0)

While RSTB is low, No instruction except status read can be accepted. Therefore, execute other instructions after making sure that DB4 = 0 (clear RSTB) and DB7 = 0 (ready) by status read instruction. The Conditions of power supply at initial power up are shown in table 1.

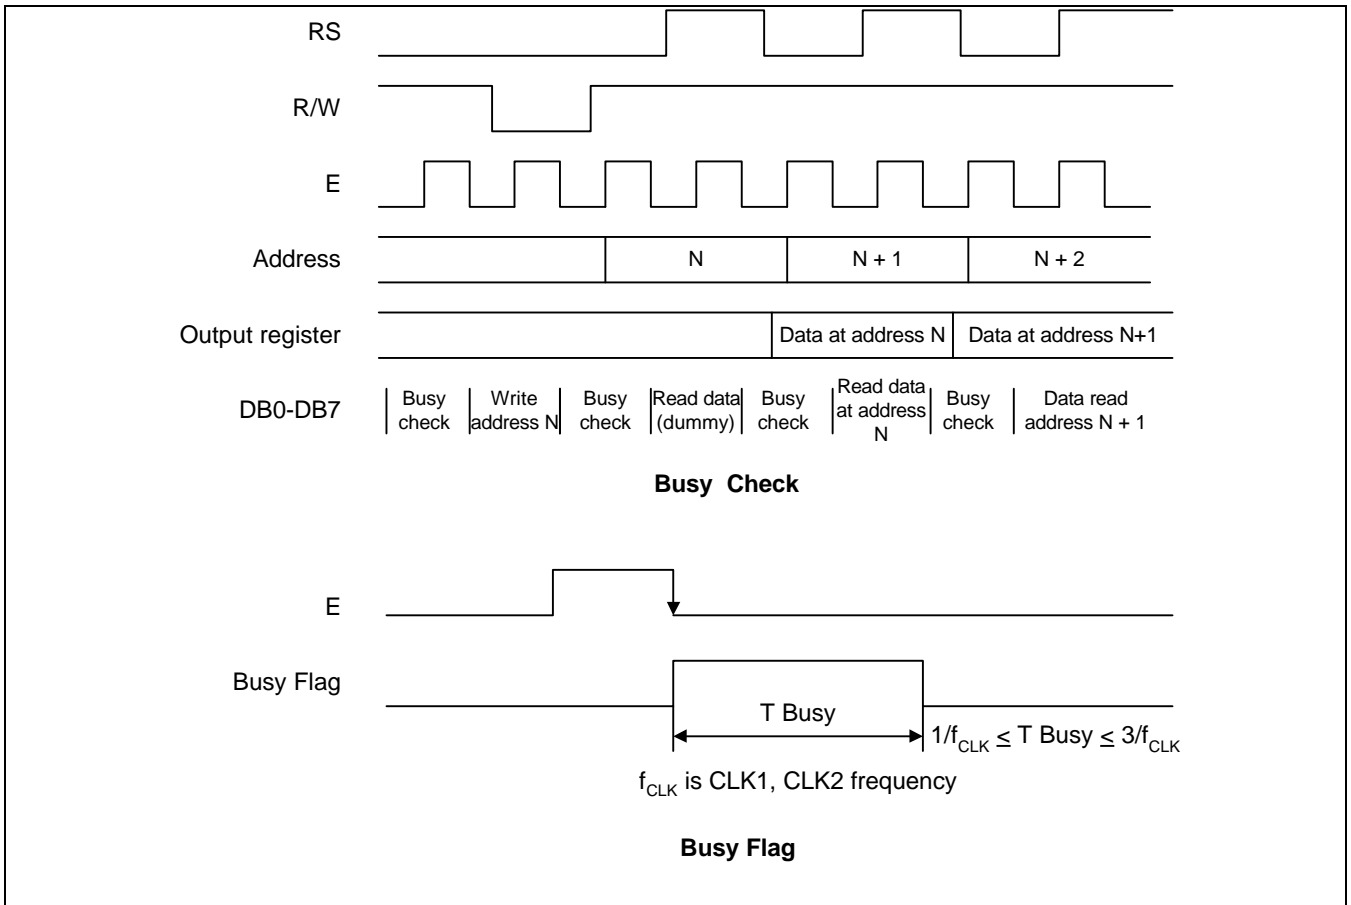

**Table 2. Power Supply Initial Conditions**

Item	Symbol	Min	Typ	Max	Unit
Reset time	$t_{RS}$	1.0	-	-	us
Rise time	$t_R$	-	-	200	ns

**Busy Flag**

Busy Flag indicates that S6B0108 is operating or no operating. When busy flag is high, S6B0108 is in internal operating. When busy flag is low, S6B0108 can accept the data or instruction. DB7 indicates busy flag of the S6B0108.

### Display ON / OFF Flip - Flop

The display on/off flip-flop makes on/off the liquid crystal display. When flip-flop is reset (logical low), selective voltage or non selective voltage appears on segment output terminals. When flip-flop is set (logic high), non selective voltage appears on segment output terminals regardless of display RAM data. The display on/off flip-flop can changes status by instruction. The display data at all segment disappear while RSTB is low. The status of the flip-flop is output to DB5 by status read instruction. The display on/off flip-flop synchronized by CL signal.

### X Page Register

X page register designates pages of the internal display data RAM. Count function is not available. An address is set by instruction.

### Y Address Counter

Y address counter designates address of the internal display data RAM. An address is set by instruction and is increased by 1 automatically by read or write operations of display data.

### Display Data RAM

Display data RAM stores a display data for liquid crystal display. To indicate on state dot matrix of liquid crystal display, write data 1. The other way, off state, writes 0.

Display data RAM address and segment output can be controlled by ADC signal.

- ADC = H → Y-address 0:S1 - Y address 63:S64
- ADC = L → Y-address 0:S64 - Y address 63:S1

ADC terminal connect the  $V_{DD}$  or  $V_{SS}$ .

### Display Start Line Register

The display start line register indicates of display data RAM to display top line of liquid crystal display. Bit data (DB<0:5>) of the display start line set instruction is latched in display start line register. Latched data is transferred to the Z address counter while FRM is high, presetting the Z address counter. It is used for scrolling of the liquid crystal display screen.

## DISPLAY CONTROL INSTRUCTION

The display control instructions control the internal state of the S6B0108. Instruction is received from MPU to S6B0108 for the display control. The following table shows various instructions.

Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Function
Display on/off	L	L	L	L	H	H	H	H	H	L/H	Controls the display on or off. Internal status and display RAM data is not affected. L: OFF, H: ON
Set address (Y address)	L	L	L	H	Y address (0 - 63)					Sets the Y address in the Y address counter.	
Set page (X address)	L	L	H	L	H	H	H	Page (0 - 7)		Sets the X address at the X address register.	
Display start line (Z address)	L	L	H	H	Display start line (0 - 63)					Indicates the display data RAM displayed at the top of the screen.	
Status read	L	H	Busy	L	On / Off	Reset	L	L	L	L	Read status. BUSY L: Ready H: In operation ON/OFF L: Display ON H: Display OFF RESET L: Normal H: Reset
Write display data	H	L	Write data								Writes data (DB0:7) into display data RAM. After writing instruction, Y address is increased by 1 automatically.
Read display data	H	H	Read data								Reads data (DB0: 7) from display data RAM to the data bus.

**DISPLAY ON / OFF**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	1	1	1	1	D

The display data appears when D is 1 and disappears when D is 0. Though the data is not on the screen with D = 0, it remains in the display data RAM. Therefore, you can make it appear by changing D = 0 into D = 1.

**SET ADDRESS (Y ADDRESS)**

S	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Y address (AC0 - AC5) of the display data RAM is set in the Y address counter. An address is set by instruction and increased by 1 automatically by read or write operations of display data.

**SET PAGE (X ADDRESS)**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	0	1	1	1	AC2	AC1	AC0

X address(AC0 - AC2) of the display data RAM is set in the X address register. Writing or reading to or from MPU is executed in this specified page until the next page is set.

**DISPLAY START LINE (Z ADDRESS)**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	AC5	AC4	AC3	AC2	AC1	AC0

Z address (AC0 - AC5) of the display data RAM is set in the display start line register and displayed at the top of the screen. When the display duty cycle is 1/64 or others(1/32 - 1/64), the data of total line number of LCD screen, from the line specified by display start line instruction, is displayed.

**STATUS READ**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BUSY	0	ON/OFF	RESET	0	0	0	0

- **BUSY**  
When BUSY is 1, the Chip is executing internal operation and no instructions are accepted.  
When BUSY is 0, the Chip is ready to accept any instructions.
- **ON/OFF**  
When ON/OFF is 1, the display is OFF.  
When ON/OFF is 0, the display is ON.
- **RESET**  
When RESET is 1, the system is being initialized.  
In this condition, no instructions except status read can be accepted.  
When RESET is 0, initializing has finished and the system is in the usual operation condition.

**WRITE DISPLAY DATA**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Writes data (D0 - D7) into the display data RAM. After writing instruction, Y address is increased by 1 automatically.

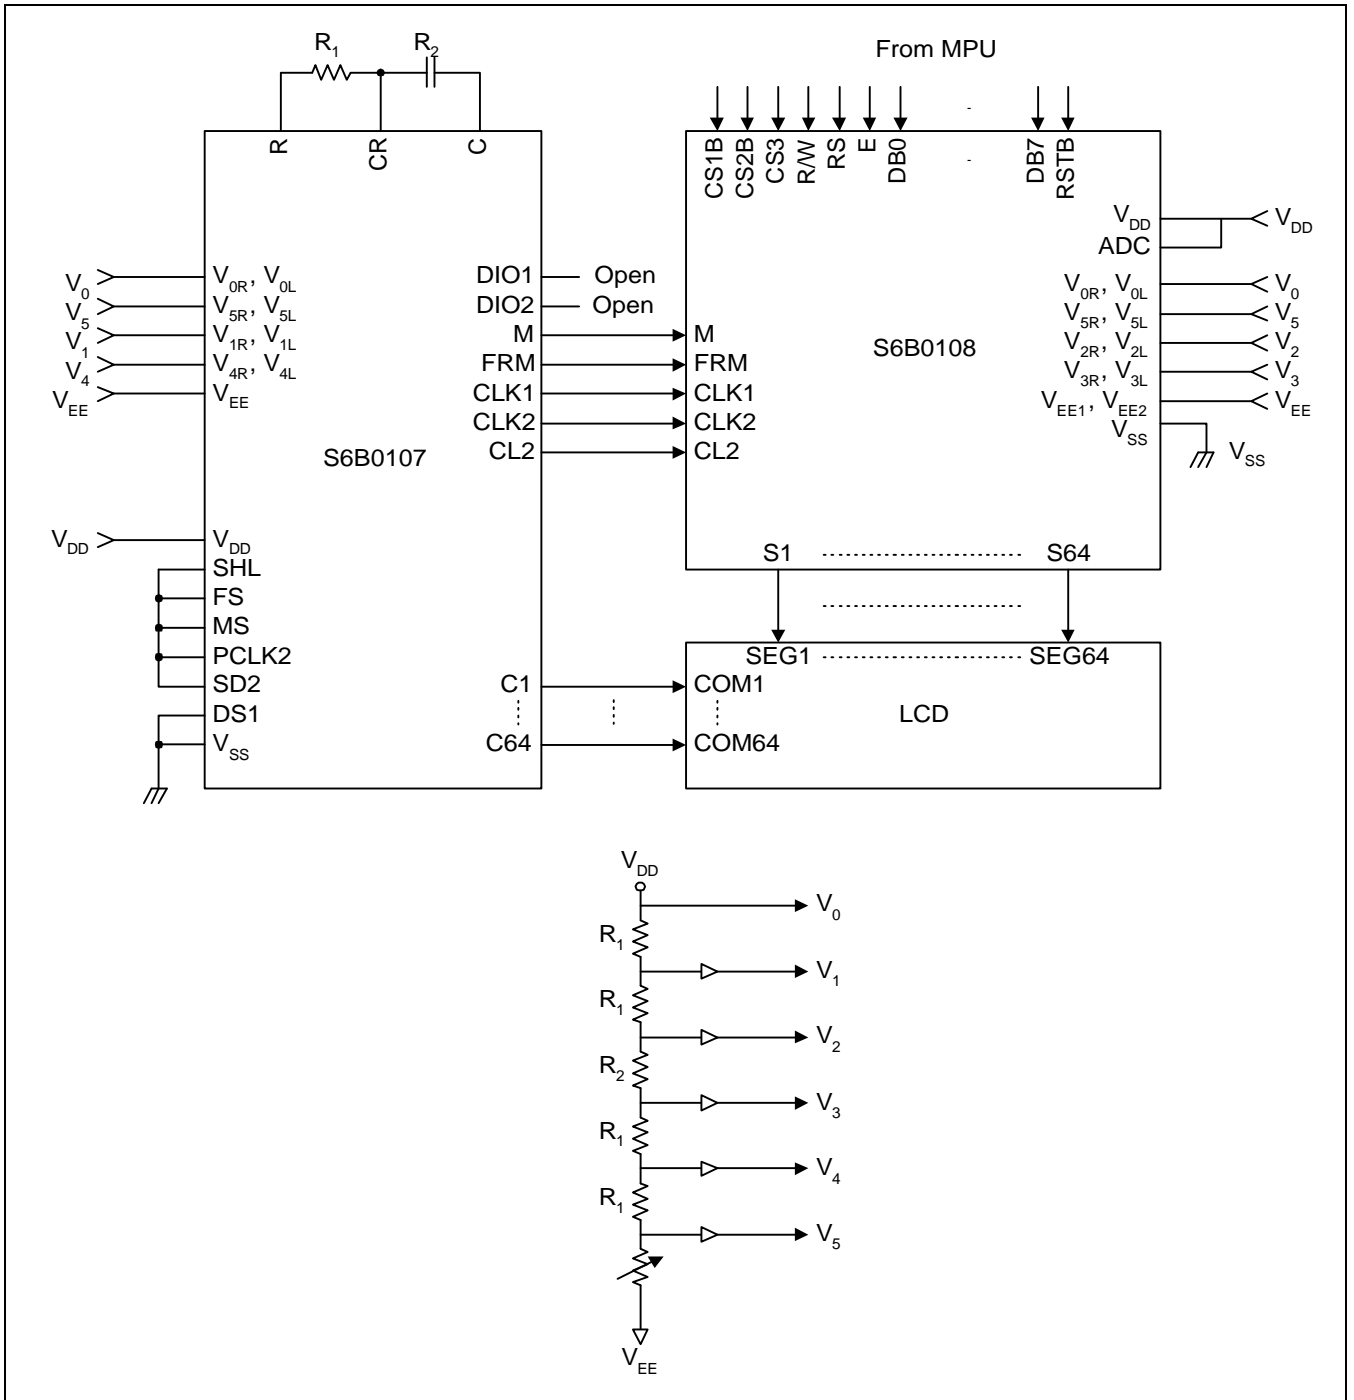

**READ DISPLAY DATA**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

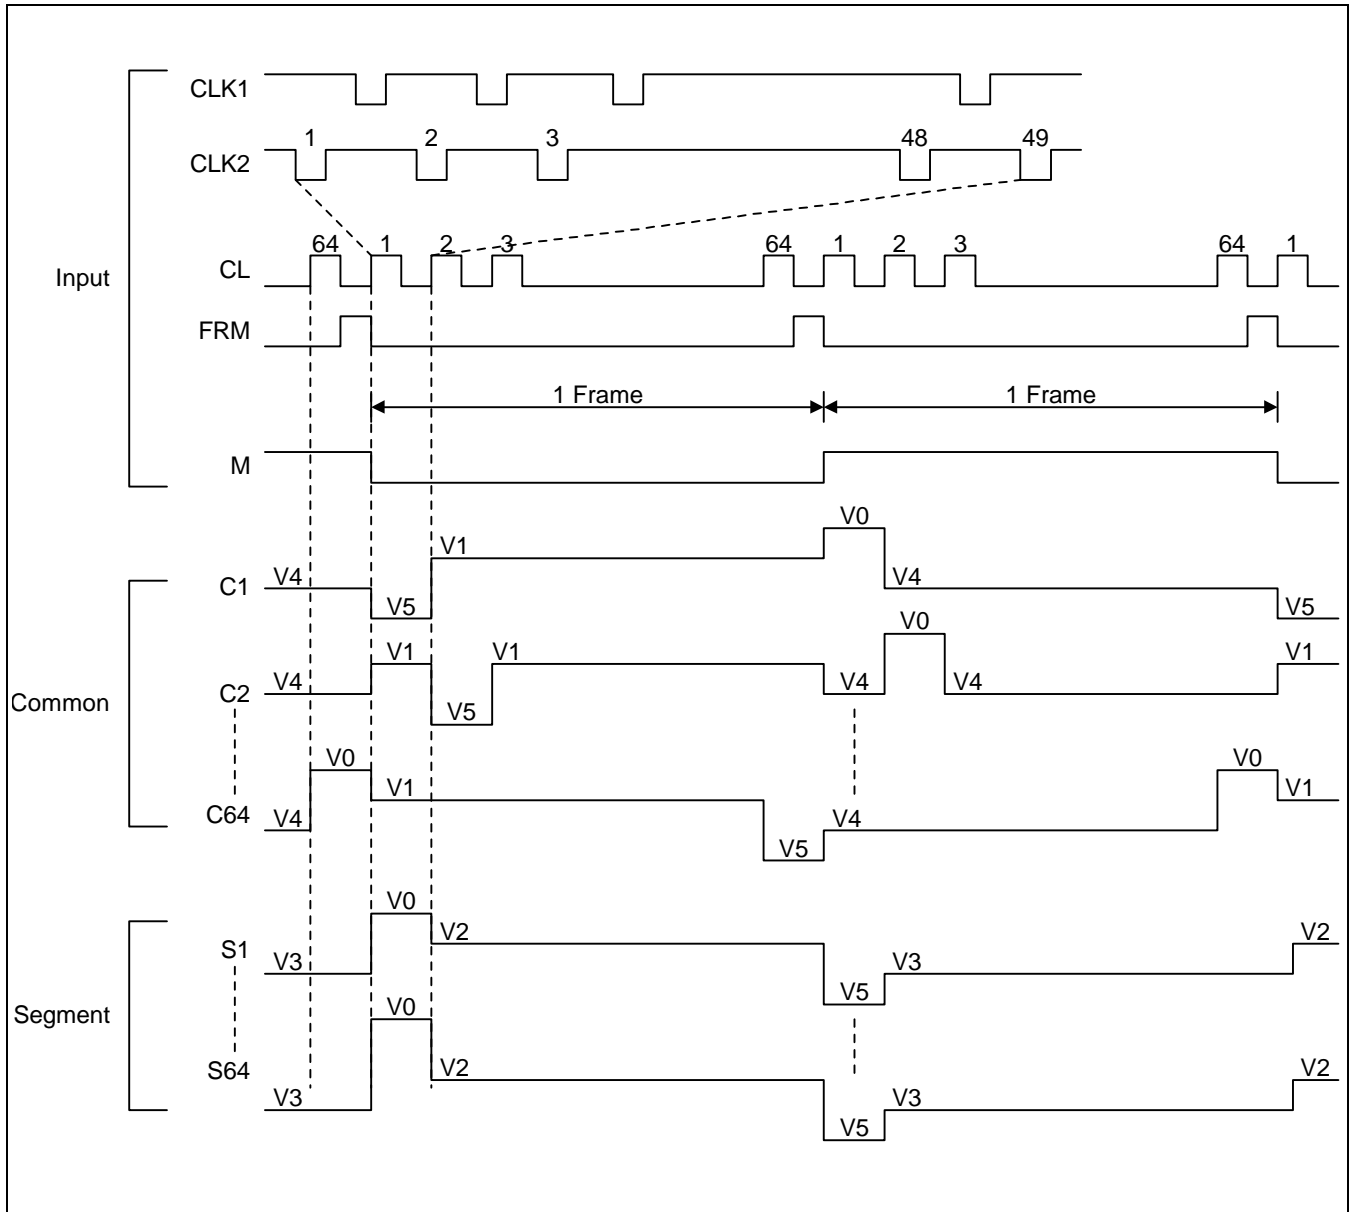

Reads data (D0 - D7) from the display data RAM. After reading instruction, Y address is increased by 1 automatically.
